

Offshore

Daily, hundreds of specially trained BRAND[®] technicians carry out maintenance work for some of the world's most renowned clients in the offshore market, ensuring that your operations continue safely, smoothly and with minimum costly downtime.

Offshore oil and gas production is an ongoing operation, 24 hours a day, 7 days a week, in some of the world's most hostile environments. Our Preventive Maintenance Programme (PMP) solutions are based on a multidisciplinary approach to maintenance for wellhead, compression, production and satellite platforms. We pre-fabricate insulation materials and supply site-specific scaffolding systems based on minimal components for ease of erection.

To optimise labour costs on offshore platforms, our operatives are multifunctional – besides their expertise in scaffolding and insulating, they are qualified professionals in painting, welding, tracing and rope access.

In offshore emergencies, it is vital that staff are appropriately trained to take immediate action to ensure the security of all crews as well as the plant. All our operatives are therefore required to complete specific offshore training programmes, including courses in first aid and firefighting.

Logistical planning is equally crucial to cost-effective work on offshore platforms. We bring considerable experience in devising expert, site-specific logistics, including scheduling of flights to platforms, to ensure the smooth implementation of solutions that are thoroughly safe and make a positive impact on lead time.
